The activated T-cells can be used to treat the same conditions by adoptive T-cell transfer therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides AAW67583-W67611 are used to produce activated T helper (CD4+) and cytotoxic (CD8+) T-cells. The activated T cells are produced by treating peripheral blood lymphocytes with liposome-enospaulated peptide antigen to generate Ag-loaded antigen-presenting cells (APC), contacting naive or anergic T-cells with these APC, and isolating the resulting partitionary one derived from a tumour, but also those from viruses, bacteria and other parasites. It can also be used to identify antigens and epitopes able to generate an Ag-specific T-cell response (by assessing proliferation and cytokine release). Also the Ag-loaded APC can be used as cellular vaccines for treating cancer (claimed) or other diseases (e.g. malaria, human immune deficiency virus infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                           Method of activation of T cells - by exposure to antigen-presenting cells loaded with antigen in liposome, used for, e.g. treating

The present sequence is the antigenic epitope P519, derived from circumsporozoite protein (CSP) of the sporozoite stage of Plasmodium falciparum. It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apitcal membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Circumsporozoite peptide antigen; malaria parasite; epitope; monoclonal antibody; affinity chromatography; DEAE-Sephadex A50 resin; diethylamine-ethyl group.

                                                                                                                                                                                                                                                            The invention relates to the use of the anion exchange resin DEAE-sephadex A50 as a solid support for solid phase peptide synthesis and affinity chromatography. The present sequence represents a repetitive plasmodium falciparum circumsporozoite peptide epitope which was used to raise monochonal antibodies. The affinity between the antibodies and free recombinant antigen was determined via competition affinity chromatography using a DEAE-Sephadex A50 column comprising a resin-bound form of the peptide epitope (AAB73754).
                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                              Use of an anion exchange resin (EPM-7) as solid support for peptide, e.g. angiotensin II, synthesis and affinity chromatography .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amino acid sequence of MAL1, which is displayed on E2 core surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               E2 core protein; 2-oxo acid dehydrogenase; multienzyme complex;

                                                                                                                                   The specification describes a truncated E2 core protein of a 2-oxo acid dehydrogenase multienzyme complex, where the protein assembles into a core structure of the complex. The E2 core protein has an ability to display a variety of different numbers of peptides or polypeptides on single complex, and the ability to display a variety of different peptides or polypeptides on the same complex. The E2 core protein is useful in screening for peptides or polypeptides which bind target proteins of interest or bound by target antibodies, or which have other desirable properties, and for the elicitation of immune responses, e.g. for vaccination. It is also useful for obtaining and/or raising antibodies to the peptides or polypeptides, for evoking an immune response, and in pharmaceutical compositions. The present sequence response, and in pharmaceutical compositions the E2 core protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a novel method of immunisation involving

0
the administration of a haematopoietic cell specific expression element to a lymphoid cell. The method is known as somatic transgene immunisation. It is particularly useful in the treatment and prevention of tunours, autoimmune disease, allergy, metabolic disorders, endocrine disorders, pain, blood disorders and dental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patentors claim a novel conjugate which comprises AAP60804 and a cartier protein. The conjugates are useful for providing protective immunity against malaria. The conjugates are effective in raising high titres of antibodies in vivo. These antibodies recognise sporozoites and neutralise sporozoite infectivity in vitro by a vigorous CSP reaction. The epitope of the P.falciparum CS protein is
                                                                                                                                        Gaps
                                                                                                                                       ö

Synthetic peptide antigen analogues of native peptide antigens which are either (1) retro modified, (2) inverso modified or (3) retro-inverso modified with respect to the native antigen can be used to raise antibodies which recognise the native antigen and hence can be used in the treatment and/or prophylaxis of diseases and therapy of disease states. They can be used in the production of vaccines and in assays for antibodies specific for the native antigen. They can have increased stability to degredation after administration and they can be administrated orally. This sequence is based on the immunodominant epitope of the circumsporozoite coat protein of plasmodium falciparum. The retro-inverso version of this peptide

Fatent No. 6231864

GENERAL INFORMATION:
APPLICANT: Birkett, Ashley J.
TITLE OF INVENTION: Strategically Modified Hepatitis B Core Proteins and TITLE OF INVENTION: Their Derivatives
FITLE OF INVENTION: Their Derivatives
FITLE REFERENCE: SYN-101 456469529
CURRENT APPLICATION NUMBER: 05/09/248,588

CURRENT FILING DATE: 1999-02-11

EARLIER PAPLICATION NUMBER: 60/074537

EARLIER PILING DATE: 1998-02-12

NUMBER OF SEQ ID NOS: 113

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 105

LENGTH: 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Plasmodium falciparum (isolate le5). Eukaryota; Alveolata; Apicomplexa; Haemosporida;	SEQUENCE FROM N.A. MEDLINE-87308186; PubMed-2442154; MEDLINE-87308186; PubMed-2442154; la Cruz V.F., Lal A.A., McCutchan T.F.; "Sequence variation in putative functional domains of the circumsporozoite protein of Plasmodium falciparum. Implications for vaccine development."; J. Biol. Chem. 262:11935-11939(1987). -!- FUNCTION: THE CIRCUMSPOROZOITE PROTEIN IS THE IMMUNODOMINANT SURFACE ANTIGEN ON THE SPOROZOITE (THE INFECTIVE STAGE OF THE MALARTA PARASITE THAT IS TRANSMITTED FROM THE MOSQUITO TO THE VETTERRATE HOST). -!- MISCELLANEOUS: THE C-TERMINAL REGION IS PROBABLY USED FOR ANCHORING THE PROTEIN TO THE CELL MEMBRANE. THE REPEAT SEQUENCES WOULD BE THE SURFACE ANTIGEN OF THE ORGANISM.	This SWISS-PROT entry is copyright. Bhella R.S., Mackenzie S.L.;

glycerol-3-phosphate acyl transferase.";

plant Physiol. 106:1713-1714(1994).

-I-FUNCTION: ESTERIFIES ACYL-GROUP FROM ACYL-ACP TO THE SN-1 POSITION

G GLYCEROL-3-PHOSPHATE. THE ENXYME FROM CHILLING-RESISTANT PLANTS

DISCRIMINATE AGAINST NON-FIUID PALMITIC ACID AND SELECT OLEIC ACID

WHEREAS THE ENXYME FROM SENSITIVE PLANTS ACCEPTS BOTH FATTY ACIDS.

-I-CATALYTIC ACTIVITY: ACYL-COA + SN-GLYCEROL 3-PHOSPHATE =

COA + 1-ACYL-SN-GLYCEROL 3-PHOSPHATE.

COA + 1-ACYL-SN-GLYCEROL 3-PHOSPHATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -i- PATHWAY: FIRST STEP IN DE NOVO PHOSPHOLIPID BIOSYNTHESIS. IT MAY ALSO FUNCTION IN THE REGULATION OF MEMBRANE BIOGENESIS.
-i- SUBCELLULAR LOCATION: CHLOROPLAST STROMA.
-i- SIMILARITY: BELONGS TO THE PLANT GPAT FAMILY.

```
The present sequence is the antigenic epitope P592, derived from circumsporozoite protein (CSP) of the sporozoite stage of plasmodium fallogrum. It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, Trecal epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (BBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the can used for treatment and prevention of malarial cativity and can used for treatment and prevention of malarial
     Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle

RESULT

This is the N-terminal of an immunogenic polypeptide useful as a malaria vaccine. It comprises a fragment of the P-falciparum cicumsporozoite protein (CSP) and one copy of a peptide linker, which is pref. present in 3-10 copies, which links the preceding

ö ö Gaps Gaps The protein was produced by expression of a synthetic gene. The analogue comprises AAs 68-123 of the native P. falciparum CS protein, followed by four repeat sequences (three "B"s, i.e. NANP) and one "A", i.e. NVDP), followed by AAs 289-392 of the native protein. Reduction of the immunological dominance of the repeats relative to the epitopes in the regions flanking the repeats enhances sporozoite neutralising activity. ; 0 sequence to a 2nd (C-terminal) sequence comprising tetrapeptide units of CSP. The peptides may be synthesised in pure form and used to generate an immune response in vaccination against malaria. The featured repeat units are claimed and must be present in copies of 2-1000, in the P.falciparum genome, the first is coded for 37 times. See also AAN60362.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1..81

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The protein was produced by expression of a synthetic gene. The analogue comprises AAs 43-123 of the native P. falciparum CS protein, followed by four repeat sequences (three "B"s, i.e. NANP) and one "A", i.e. NVDP), followed by AAS 289-374 of the native protein. Reduction of the immunological dominance of the repeats relative to the epitopes in the regions flanking the repeats enhances sporozoite neutralising activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225 : 593 (1984)], and the influenca virus non-structural protein 1 (NS1), [Baeze et al., Nucleic Acids Research, 8 : 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NS1 (NS1 81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-contg. flanking region I less the first nine N-terminal AAs. This CS fusion is designated RLfdelta9. The Pro residue separating the ASP (at the C-terminal of the linker) from RLfdelta9 is an artifact of a filled in BamHI site. The peptide can be used in a vaccine for protection against
                                                                                                                                                                                                                                                                                                                                                                             Polypeptide comprising immunogenic determinants from P falciparum for vaccine against malaria infection in humans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunogenic determinant; circumsporozoite; CS; vaccine; malaria; hybrid; influenza virus; non-structural protein 1; fusion.
                                                                                                                                                                                                                                     New polypeptide used in malaria vaccine - comprises immunogenic determinants from 1st and 2nd flanking regions of plasmodium surface protein and intermediate repeat domain
                                                                                                                                                                                                                                                                                                                                                                    The product is useful in preparation of vaccines for treatment a prophylaxis of plasmodium sporozite infection. It may be easily produced in large pure quantities from a transformed E.coli expression system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein [NSI), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AA signal region, which in C turn is fused to DNA encoding Region II-contg. flanking regions Region II-contg. flanking region of the Asp (at the C-terminal of the linker) from Rifauth is an artifact of a filled in BamHI site; the Gly separating Region II-contg. CS flanking regions is an artifact of a filled in BamHI site; the Gly separating Region II-contg. CS flanking regions is an artifact of a synthetic protection against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NS1), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NS1 (NS1_81) is linked via a synthetic sequence to DNA encoding Region I conty, flanking region less the 18 AAS signal region. This is linked to a synthetic sequence encoding two repeat units from the mmunodominant region, which in turn is fused to DNA encoding Region II.conty. flanking region. The Pro residue separating the C terminal of the linker) from the Region I-conty. C separating the repeat units and the Region II-conty. CS flanking region is an artifact of a filled-in BamHI site; the Gly separating the repeat units and the Region II-conty. CS flanking region is an artifact of a synthetic FOKI/TthIII I linker. The peptide can be used in a vaccine for protection against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                      g
                                                                                                                         δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NS1), [Bazz et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NS1 (NS1_81) is linked to a synthetic sequence encoding four repeat units from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region I contg. flanking region less the 18 AA signal region. This is linked to DNA encoding Region II-contg. flanking region. This is linked to DNA encoding the Asp (at the C-terminal of the linker) from the Region II-contg. CS flanking region is an artifact of a filled-in BamHI contg. the Gly separating the Region I and II-contg. Sc flanking region is an artifact of a synthetic Foki/TthiII I linker. The peptide can be used in a vaccine for protection against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptide comprising immunogenic determinants from P falciparum for vaccine against malaria infection in humans.

the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NSI (1981) is linked to a synthetic sequence encoding four repeat units (the variant form) from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region II-contg. Cantg. flanking region less the 18 AA signal region. This is contg. flanking region II-contg. flanking region is an artifact of a filled-the Region I-contg. CS flanking region is an artifact of a filled-the Region I-contg. CS flanking region is an artifact of a filled-the Region I-contg. CS flanking region is an artifact of a flanking regions is an artifact of a synthetic Fokl/TthiII I

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His) 6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (MAA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, PfG27. These epitopes were obtained at different stages of the life cycle of Plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                         Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note="Repeat region, repeat unit = NANPNVDP"

                                                                                         Sequence of the CS gene (AAN81108) is from lambda-mpfl. A recombinant DNA molecule is claimed, comprising functional DNA coding sequence fused, in phase, to a portion of the Pre-S2 region of a hepatitis B virus (HBV) Pre-S2-S protein coding sequence. The functional DNA coding sequence comprises the Pre-S2 coding sequence, Pre-S1 coding sequence, the CS protein coding sequence or entire Plasmodium, or a HIV coding sequence such as an HIV coding sequence such as an HIV envelope gene sequence, e.g. HIV C7 protein coding region, HIV Peptide 121 coding region, or HIV Dreesman peptide coding region.

plasmid WR201 was obtained from the Walter Reed Army Institute of Research, and results from insertion of a 2.3 kb EcorI fragment from lambda mpfl encoding the complete CS protein gene P. falciparum into vector pUCB. A recombinant DNA vector is claimed, which comprises a DNA sequence contg. the coding sequence of the CS P. falciparum operatively linked to an expression control sequence. Prefd. expression control sequences include the yeast glyceraldehyde-3P-dehydrogenase gene (TDH3) promoter and the yeast confithine carbamoyl transferase gene (ARG3) transcription termination region. A suitable coding sequence comprises the 1215bp Stul-Rsal fragment of WR201 contg. the P. falciparum CS protein coding sequence, minus its first 50bp. Also claimed is a

```

```
transformed host cell, a method of culturing the cell to produce CS, the protein, and a vaccine. The vector comprises a 192 bp Sau3A fragment coding for 16 tetrapeptide repeats of the P. falciparum CS protein coding form Sau3A digestion of a 1215 bp Stul Rsal fragment of WR201 containing the P. falciparum CS protein coding sequence minus cc approx. Its first 50 bp, or two, three, four or more tandem copies of XX Sequence 412 AA;
